Results from Experiment 1 (Rio, Dachner, \& Warren)

Figure S1. Speed perturbations in Experiment 1: Mean absolute change in speed as a function of the number of neighbors in the perturbed subset S . This figure is paired with Figure 2a in Rio, Dachner, \& Warren. Error bars=SE of mean.

## Simulations of Experiment 1 (Rio, Dachner, \& Warren)

Figure S2. Simulations of heading perturbations and speed perturbations in Experiment 1. Top: Mean time series of (a) heading and (b) speed for human data (solid curves) and model (dashed curves) at each subset size $S$ (number of perturbed neighbors, colored curves). Bottom: Mean absolute final (c) heading and (d) speed as a function of the number of perturbed neighbors S . Shaded regions $=95 \%$ CI for human data.

Figure S3. Mean time series for human data (solid curves) and model (dashed curves) in Experiment 2. Top: Mean time series of heading for each subset size $S$ (number of perturbed neighbors, colored curves) in (a) the Near condition ( $\sim 1.5 \mathrm{~m}$ ) and (b) the Far condition ( $\sim 3.5 \mathrm{~m}$ ). Bottom: Mean time series of walking speed in (c) the Near condition and (b) the Far condition. Note that smaller subsets $S=0,3,6$ (green, cyan, black) illustrate the effect of distance, as nearly all were in the near zone ( 5 neighbors) or the far zone ( 7 neighbors).

Simulations of Individual Trajectories in a Human 'Swarm' (Rio, Dachner, \& Warren)

Figure S4. Simulations of sample 10 s segments from the human 'swarm' data. (a) IPD=2m, mean position error $=0.51 \mathrm{~m}$, speed $r=.76(\mathrm{RMSE}=0.14 \mathrm{~m} / \mathrm{s})$, heading $r=0.94$, (RMSE $=21.12^{\circ}$ ). (b) $\mathrm{IPD}=1 \mathrm{~m}$, mean position error $=0.32 \mathrm{~m}$, speed $r=0.24$ ( $\mathrm{RMSE}=0.07 \mathrm{~m} / \mathrm{s}$ ), heading $r=0.99$ ( $\mathrm{RMSE}=9.3^{\circ}$ ). (c) $\mathrm{IPD}=2 \mathrm{~m}$, mean position error $=0.60 \mathrm{~m}$, speed $r=0.80(\mathrm{RMSE}=0.18 \mathrm{~m} / \mathrm{s})$, heading $r=0.94$ ( $\mathrm{RMSE}=10.01^{\circ}$ ). (d) $\mathrm{IPD}=2 \mathrm{~m}$, mean distance error $=0.29 \mathrm{~m}$, speed $r=0.33$ (RMSE-0.11 m/s), heading $r=0.86\left(\right.$ RMSE $\left.=7.14^{\circ}\right)$. Participant $=$ solid red curve, model $=$ dashed blue curve, neighbors $=$ black curves; $\mathrm{O}=$ starting positions, $\mathrm{X}=$ final positions.
