Summary: For bromeliad microecosystems containing tadpoles exposed to *Batrachochytrium dendrobatidis* (Bd), a water treatment (natural or pre-sterilized), and an arthropod treatment (present or absent) for 17 d: rarefaction curves for bacterial sequences, average relative abundance of the most common bacterial phyla, results of generalized linear models and permutation multivariate analyses of variance, and differentially abundant OTUs for each treatment.

Figure S1. Rarefaction curves for all samples. At a rarefaction level of 10,000 sequences per sample, the curves have plateaued, indicating comprehensive representation of the bacterial communities within each sample. At the same time, this level of rarefaction minimized exclusion of samples (with < 10,000 total sequences). All tadpole samples and 39/48 environmental samples were retained at this level of rarefaction.

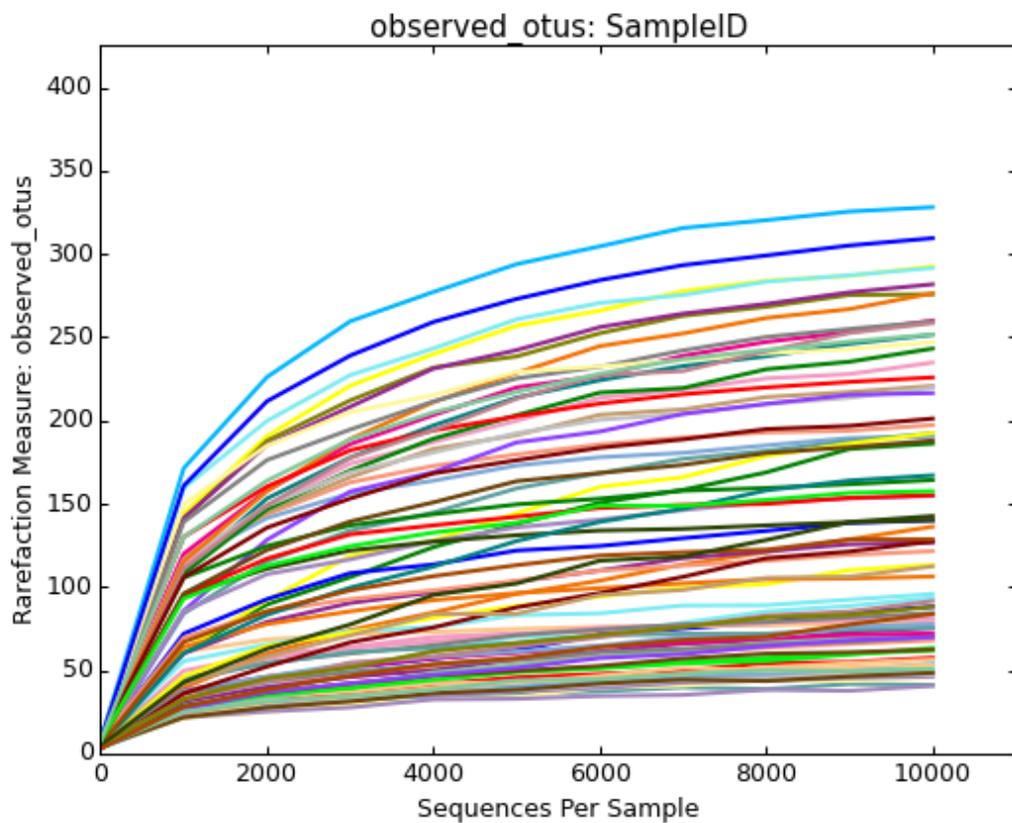

Figure S2. Average relative abundance of the most common bacterial phyla in environmental bacterial communities and tadpole microbiomes. All samples were rarefied to 10 000 reads.

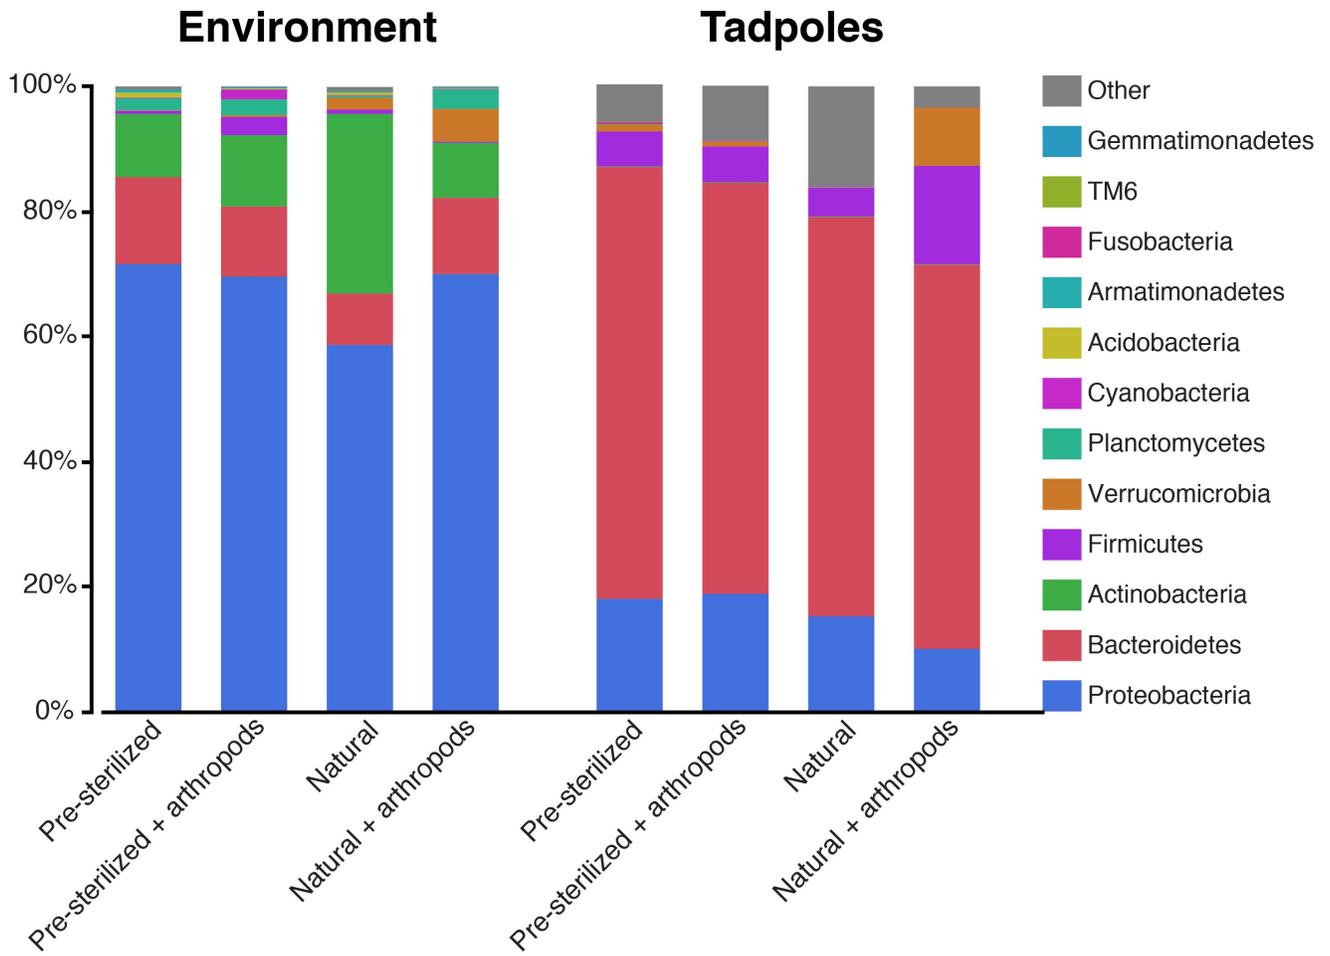

Table S1. Generalized linear models (GLM) and permutation analyses of variance (PERMANOVA) testing effects of water treatment, arthropod treatment, and their interactions on environmental bacterial community structure, host (tadpole) bacterial community (microbiome) structure, fungal pathogen abundance, tadpole body mass, and water quality.

**Environment: phylogenetic bacterial diversity**
