## Methods

### Sampling locations

Details of sampling locations in the Vance and Morne rivers are described in [1]. Within the Vance, 20 fish were sampled from the polluted stretch and 19 from the clean and within the Morne 17 were sampled from the polluted stretch and 16 from the clean. 30 fish were sampled from a relatively clean location in the Tacarigua River is N10°41'229" W061 21'31.5 and 29 fish were sampled from a relatively clean stretch of the Acono River is N10°42'484" W061 23'52.5.

### Cyp1A genotyping

Microsatellite loci were amplified using the Type-it Microsatellite PCR Kit (Qiagen) with a total volume of 9 µl. Primers used for amplification were Cyp1A\_ms\_f (ACCATTCCATTCAAGTTGTAAGC) and Cyp1A\_ms\_4 (TCATTTGGCACTGACAAG) corresponding to positions 2113 -2136 and 2312-2292 in XM\_008405514 respectively. Amplicons were run on a Beckman Coulter DNA sequencer. Microsatellite genotypes were determined using the Fragment Analysis on CEQ 8000 (Beckman Coulter). A ‘touchdown’ PCR program was used, consisting of 5 min at 95 °C followed by 35 cycles of 30 s at 95 °C, 30 s at the annealing temperature [62 °C (2 cycles), 58 (3), 55 (5), 53 (10), 51 (5), 49 (5), 47 (5)] and 1 min at 72, then 72 and 60 °C for 10 and 35 min respectively.

The sequences of primers used for amplification and sequencing the 718 bp fragment of the Cyp1A gene (206-932 bp in XM\_008405514.1) were forward (CTWCGTCRACTCCYGGCCC) and reverse (CAAARHGTAGTGCTCRSTGAC). Phusion® High-Fidelity DNA Polymerase (NEB) was used for PCR amplification in order to minimise PCR errors. PCR products were run on an agarose gel, purified and then sent for Sanger sequencing (Source Biosciences, Nottingham). Consensus sequences were assembled from electropherogram alignments using DNABASER (<http://www.dnabaser.com/home.html>).

### **Restriction site associated (RAD)-seq genotyping**

Restriction site associated RAD libraries were prepared according to the methodology described in Etter et al. [2]. Briefly, 1.0 µg DNA per from each fish sample was digested with *SbfI*-HF (NEB). Digested DNA was ligated to P1 adaptors with barcodes unique for each fish (Table S1). These 16 samples were pooled with other samples from another project for paired-end sequencing ( $100 \times 2$  bp target) on a single lane of an Illumina HiSeq 2500 at the University of Exeter Sequencing Service. Summary statistics of raw sequencing reads are given in Table S1.

Table S1 - Summary statistics of raw sequencing reads, and mean merged stack depth coverage for guppies analysed in this project.

Sample code	River	Barcode	Total sequence reads with barcode	No. sequences retained	Merged Stack depth coverage
GupVan1	Vance	GAAGC	14576202	13230669	98.5
GupVan2	Vance	GACTA	11869056	10831399	90.2
GupVan3	Vance	GAGAT	16509604	14849446	114.3
GupVan4	Vance	GATCG	7492410	6805138	64.5
GupVan5	Vance	GCATT	6181344	5394675	42.3
GupVan6	Vance	GCCGG	6474992	5880635	48.6
GupVan7	Vance	GCGCC	3026428	2653012	25.3

GupTacCl4	Tacarigua	GGTTC	7649536	6907453	53.7
GupTacCl5	Tacarigua	GTACA	8164260	7474067	59.5
GupTacCl6	Tacarigua	GTCAC	5854056	5283060	41.0
GupTacCl7	Tacarigua	GTGTG	3559848	3082145	28.9
GupTacCl8	Tacarigua	TTTGT	8081314	7314693	60.3

We used Stacks 1.29 [3-4] for SNP discovery and genotyping from the sequenced RAD tags. ‘process\_radtags’ was used for quality filtering of raw reads and demultiplexing based on barcodes, ‘ustacks’ was used to assemble stacks of similar sequences in each individual and a catalog of loci was created with ‘cstacks’. Parameter values used were: minimum depth of coverage required to create a stack (m) = 3, maximum distance (in nucleotides) allowed between stacks (M) = 3, and maximum distance allowed to align secondary reads to primary stacks (n) = 1. FST values were calculated in ‘populations’ using SNPs that were retained in more than 80% of individuals.

We examined for enriched gene ontology (GO) terms in RAD loci which had FST values of greater than 0.75. This stringent cutoff was used because of the low number of fish sampled from each river (n=8). BLASTx [5] against the zebrafish Ensembl [6] peptide database was used to identify RAD loci that fell within genes, using an *e* value cut off of  $< 1 \times 10^{-5}$ . Of the 1632 loci with  $FST > 0.75$ , 591 fell within 493 unique genes. GO analysis was conducted in Database for Annotation, Visualisation and Integrated Discovery (DAVID) [7-8], using the *Danio rerio* as a background. Overrepresented GO terms are shown in Table S2, and Tables S3-S7 list the overrepresented genes within these categories.

Table S2 - Gene Ontology Terms over-represented in the list of genes with an  $FST > 0.75$  between guppy populations from the oil-polluted Vance River and the relatively clean Tacarigua River. This analysis was conducted using the Database for Annotation, Visualisation and Integrated Discovery (DAVID) [7-8], using the *Danio rerio* as a background. Only terms that were significant ( $p < 0.05$ ) after Benjamini–Hochberg correction are shown.

Category	Term	Count	%	P-value	Benjamini
GOTERM_BP_1	biological adhesion	10	2.9	3.40E-03	5.70E-02
GOTERM_BP_1	cellular process	83	23.7	7.10E-03	5.80E-02
GOTERM_CC_2	extracellular matrix part	4	1.1	3.80E-03	9.30E-02
GOTERM_MF_2	ion binding	59	16.9	8.60E-05	2.70E-03
GOTERM_MF_3	cation binding	59	16.9	2.80E-04	1.50E-02
GOTERM_MF_4	metal ion binding	58	16.6	4.70E-04	2.50E-02
GOTERM_MF_4	glycosaminoglycan binding	4	1.1	2.00E-03	5.10E-02

Table S3 - Genes within overrepresented GO term ‘biological adhesion’ (GOTERM\_BP\_1).

ENSEMBL_GENE_ID	GENE NAME
ENSDARG00000058543	laminin, alpha 5
